

Accurate & economical weigh-filling of powdered products

Accurately weighing powdered milk, detergent and other high-value, finely ground products is a difficult process. Dry powders easily stick or bridge making them difficult to transfer consistently. Containing powders without leaks long enough to get an accurate weight, and then quickly and completely releasing them without sticking, is equally challenging.

The Ishida Solution

Ishida has developed the low-priced solution for accurate weigh-filling of powdered milk, drink mixes, detergents, and many other powder products.

Currently used by a variety of processors, the Ishida Model CCW-DP-210 multihead weigher provides Ishida's industry-leading accuracy, dependability and easy cleaning features at an economical price.

The DP-210 uses highly polished product contact surfaces and steeply angled infeed and discharge chutes to maintain a constant flow of powders. Leakproof hoppers assure precise weight measurement and quick release of powdered products.

For package weights of 125g, 250g, 400g and 500g, the Ishida DP-210 delivers consistent accuracy of +/- 1 gram at speeds up to 60 weighments per minute.

A double-opening discharge timing hopper ensures fast product transfer to bagmakers and other packaging machinery.

As with all Ishida weighers, all product contact parts can be removed without using tools for fast, easy cleaning. Plus, one call to Heat and Control delivers complete service, parts, training and technical support.

Ishida DP-210
gives you every advantage
over volumetric scales

Better speed and accuracy

Simpler setup, target weight
and format changeovers

Easier cleanup
and maintenance
